

INSPECTION AND CERTIFICATION OF STORAGE SYSTEMS

Do you know the risks associated with pallet racking in your premises?

Storage systems which are improperly installed, worn, overloaded, damaged or uncertified will make your warehouse vulnerable to hazards.

Your storage systems, such as pallet racks or mezzanines, face high demands on a daily basis, and therefore any weakening will have an impact on their load capacity.

This could lead to consequences as harmful as:

- Work interruptions
- Costly repairs
- Damaged merchandise
- Accidents, serious injuries, death ...

Why have your storage systems inspected and certified?

- Ensure that they comply with Law C-21, CSA A344 and other standards
- Make your warehouse more secure and thus protect your employees
- Ensure the optimal functioning of your existing installations
- Protect your inventory and thus guarantee the longevity and efficiency of your installations.

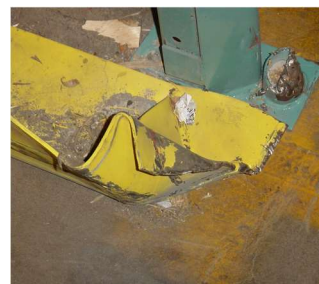

At Pedlex, the safety of our customers and their employees is very important. That is why we offer you an inspection and certification service for all your storage systems, personalized according to your facilities and your needs.

Our experts trained according to CNESST standards will assist you in the inspection and certification of your installations sealed by the Ordre des ingénieurs du Québec. We will then be able to assess with you the corrections to be made.

Bill C-21 :

According to Bill C-21 - an employer can be found guilty of criminal liability for "poor management of occupational health and safety".

Protect yourself against risks by having your storage systems inspected and certified!

The solution?

Our certified safety engineer will **visit your premises to examine your racks or mezzanine** carefully and assess any damage.

Following our list of 30 checkpoints, he **will advise you** on existing or follow-up problems, such as:

- Damaged or poorly maintained racking structure
- Overloaded beams
- Pallets positioned dangerously
- Beams poorly located or mounted without safety clips
- Deformed support frames
- General damage

Then, he will **recommend the necessary detailed corrections**. Once compliant, your installation **can then be certified**.

We can **train your employees** on the proper use of your storage systems and how to properly carry out your monthly inspections.

An accompaniment service is also available.

Reduce the risk of accidents: have your storage systems certified!

Even the most robust and reliable pallet racking could easily become weakened and dangerous for many reasons. The most common are improper assembly, poor maintenance, overloading, operator error or failure to follow operating instructions.

Have your facilities certified to make them compliant with the law on health and safety at work by our partner, a company specializing in the field of industrial storage engineering with over 20 years of experience!

How often should you do an inspection?

Our experts recommend having your shelving or mezzanine inspected after installation, and then every year or more depending on your use and needs.

Excellence is one of our values

That's why we offer these services for our customers that are even more important in complex work environments. Take advantage of our offer and talk to your Pedlex representative to have your facilities inspected.

Be aware of the maintenance needs of your pallet racks thanks to the inspections and certifications carried out by our storage experts. These services are in addition to our great expertise in providing you with ergonomic and of course, safe storage and warehousing systems!
